1. Project Purpose

A peer-to-peer platform designed for ease-of-use, reliability and real-world utility.

Blockchain technology and cryptocurrency have been around for over a decade. Still many find the space intimidating, we're working to change that. We handle the technical end of things, and users can enjoy the benefits of a technology that has already revolutionized identity and ownership.

1st Base delivers a complete, self-contained environment that runs directly in the user's browser. Taking advantage of web-based interfaces for substantial compatibility advantage across all devices and architectures.

The core team and partners have direct access to feature management. Whilst the decentralization of infrastructure provides deliberate isolation from third-parties, limiting bot traffic, malicious actors and the tracking of personal information.

2. Consensus

Semi-centralized; yes that is not a typo - often described as a big red flag and a source of distrust. However, these concerns are dated and have done nothing to mitigate the scams the have dominated the industry, instead these unwritten rules have evolved into unforeseen stagnation in policy and developer growth.

Over-bearing control given to the public, forces projects to default to the "safe" option, missing out on potential growth. This however, should not be misinterpreted, we are well aware of the associated risks and always aim to minimize the project's exposure in everything we do.

2.1 Centralised Aspects

- Product research and development.
- Design/ branding.
- Source code maintenance.
- Oversight of partnerships and ventures.
- Documentation of public-facing components.
- Strict management policy with vetted appointments.
- Risk management.

Transparency and decision-making prove to be more efficient, when responsibility is limited to a relatively small group of individuals with clear roles and expertise. Enabling rapid response, consistent standards and reliability.

2.2 Decentralised Aspects

- Mining.
- Third-party node/explorer hosting.

Whilst it may appear as a small contribution at first glance. These two functions alone serve the most essential aspects to trust within the block chain ecosystem, improving network resilience and redistributing the underlying coin/asset.

Mining often demonized as wasteful, remains a cost-effective consensus mechanism. Flexible to supply and demand, whilst presenting a low barrier for entry in terms of purpose built or idle hardware.

3. Tokenomics

1st Base employs a sustainable development model designed for long-term viability and value. Built on the trusty proof-of-work reward mechanism and deflationary monetary policy. The total supply is capped at 1 million coins.

3.1 Genesis Allocation

A pre-mine assigns 75% of the maximum supply into developer and company custody. 500,000 Coins have been vested with the parent company for a minimum of 24 months and will be revisited pending a shareholder assessment. All of which serve as a reserve for project operations, including but not limited to;

- Organizational overheads;
 - Legal Compliance.
 - Accounting.
 - Documentation.
 - Research and Development.
 - Production infrastructure and services.
- Partnership equity.
- Strategic sponsorship of open-source dependencies.
- Marketing and design.
- Bug bounty campaigns.
- Exchange costs and liquidity.
- Emergency reserve / investor protections.
- Charity reserve /community outreach.

3.2 Network Distribution

- 25% is distributed through CPU mining.
- Initial block reward 0.1 FIRST, divided by 1.1111 every 12 months.

Combining the Ultra-low power mining algorithm with a low supply. Transaction fees alone would be sufficient for sustaining network security long after block rewards taper off, 30 years from launch.

The economic model replaces the unpredictability of volunteer and community solicited contributions, with accountable, outcome-oriented stewardship.

3.3 Revenue Model

The semi-centralized nature of 1stBase is intentionally designed to sustain the for-profit company and to grow along with it. As the MVP roll-out is completed, on chain services and features will be upgraded from free trials to premium service costs. These transitions will be subject to developer satisfaction, taking robustness and user experience into account when making the decision.

4. On-chain apps

4.1 Social

A new standard for communication infrastructure, decentralized chatrooms and user profiles.

No logins required. Using a unique on-chain solution:

- Users can suggest and vote on topics for real-time conversations.
- Create custom profiles, avatars and lease unique usernames straight from their wallet.

All of this translates to a fully transparent, bot and algorithm free experience - where users have all the controls to moderate what they see and who they choose to interact with.

Your identity is stored on the block chain, we do not control your data.

4.2 Factions

A multiplayer text-based strategy game, time is tracked by block height, game progress is saved on-chain.

“Choose Your Faction, Shape Your Destiny.”

22 strategic sectors across 4 rings. To accommodate a global population of half a million players.

Vote for alliances, upgrade buildings, assemble armies, collect resources and compete for your spot in the global rankings.
